Afternoon	Paper Reference 8FM0/23								
Further Mathematics Advanced Subsidiary Further Mathematics options 23: Further Statistics 1 (Part of options B, E, F and G)									
You must have: Mathematical Formulae and Statistical Tables (Green), calculator									

Candidates may use any calculator allowed by Pearson regulations. Calculators must not have the facility for symbolic algebra manipulation, differentiation and integration, or have retrievable mathematical formulae stored in them.

Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B).
- Fill in the boxes at the top of this page with your name, centre number and candidate number.
- Answer all questions and ensure that your answers to parts of questions are clearly labelled.
- Answer the questions in the spaces provided
 - there may be more space than you need.
- You should show sufficient working to make your methods clear. Answers without working may not gain full credit.
- Values from the statistical tables should be quoted in full. If a calculator is used instead of the tables, the value should be given to an equivalent degree of accuracy.
- Inexact answers should be given to three significant figures unless otherwise stated.

Information

- A booklet 'Mathematical Formulae and Statistical Tables' is provided.
- The total mark for this part of the examination is 40. There are 4 questions.
- The marks for **each** question are shown in brackets
 - use this as a guide as to how much time to spend on each question.

Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

Autumn 2020 Shadow Papers: 8FM0-23 Further Statistics 1 - Set 1 - Question Paper (Version 1.0) © Pearson Education Ltd.

1	A plumbing company receives call-outs during the working day at an average rate of 3.2 per hour.					
	(<i>a</i>)	Find the probability that the company receives exactly 8 call-outs in a randomly selected 2-hour period of a working day.	(2)			
	The	company has enough staff to respond to 35 call-outs in an 8-hour working day.				
	(<i>b</i>)	Show that the probability that the company receives more than 35 call-outs in a randomly selected 8-hour working day is 0.0302 to 4 decimal places.				
			(2)			
	In a	random sample of 50 working days each of 8 hours,				
	(<i>c</i>)	(i) find the expected number of days that the company receives more than 35 call-outs,				
			(1)			
		(ii) find the standard deviation of the number of days that the company receives more than 35 call-outs,				
			(2)			
		(iii) use a Poisson approximation to estimate the probability that the company receives more than 35 call-outs on at least 7 of these days.				
			(3)			
		(Total for Question 1 is 10 mark	(s)			

out the experiment 80 times with his left hand and 80 times with his right hand.
Number of heads

In an experiment, James flips a coin 4 times and records the number of heads. He carries

	Number of heads						
	0	1	2	3	4		
Left hand	13	14	20	12	21		
Right hand	12	17	22	14	15		

(*a*) Test, at the 10% level of significance, whether or not there is an association between the hand he flips the coin with and the number of heads.

You should state your hypotheses, the degrees of freedom and the critical value used for this test.

(b) Assuming the coin is unbiased, write down the distribution of the number of heads in 4 flips.

(1)

(c) Carry out a χ^2 test, at the 5% level of significance, to test whether or not the distribution you wrote down in part (b) is a suitable model for the number of heads obtained in the 160 trials of James' experiment.

You should state your hypotheses, the degrees of freedom and the critical value used for this test.

(7)

(7)

(Total for Question 2 is 15 marks)

3 The probability distribution of the discrete random variable *X* is

$$P(X = x) = \begin{cases} \frac{k}{x} & \text{for } x = 1, 3 \text{ and } 6\\ \frac{m}{3x} & \text{for } x = 2 \text{ and } 4\\ 0 & \text{otherwise} \end{cases}$$

where *k* and *m* are positive constants.

2

Given that E(X) = 2.6, find Var(X)

(7)

(Total for Question 3 is 7 marks)

4 During the morning, the number of cyclists passing a particular point on a cycle path in a 10-minute interval travelling eastbound can be modelled by a Poisson distribution with mean 6

The number of cyclists passing the same point in a 10-minute interval travelling westbound can be modelled by a Poisson distribution with mean 2

(*a*) Suggest a model for the total number of cyclists passing the point on the cycle path in a 10-minute interval, stating a necessary assumption.

(2)

Given that exactly 11 cyclists pass the point in a 10-minute interval,

(b) find the probability that at least 10 are travelling eastbound.

(3)

After some roadworks were completed, the total number of cyclists passing the point in a randomly selected 30-minute interval one morning is found to be 17

(c) Test, at the 10% level of significance, whether there is evidence of a decrease in the rate of cyclists passing the point.State your hypotheses clearly.

(3)

(Total for Question 4 is 8 marks)

TOTAL FOR FURTHER STATISTICS 1 IS 40 MARKS
