--	--	--	--	--

Candidate Number

--	--	--	--	--

**Mock Paper – Set 2**

Paper Reference **9MA0/32**

**Mathematics**

**Advanced**

**Paper 32: Mechanics**

**You must have:**

Mathematical Formulae and Statistical Tables (Green), calculator

Total Marks

--

**Candidates may use any calculator allowed by Pearson regulations. Calculators must not have the facility for symbolic algebra manipulation, differentiation and integration, or have retrievable mathematical formulae stored in them.**

### Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B).
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer **all** questions and ensure that your answers to parts of questions are clearly labelled.
- Answer the questions in the spaces provided – *there may be more space than you need.*
- You should show sufficient working to make your methods clear. Answers without working may not gain full credit.
- Unless otherwise indicated, whenever a value of  $g$  is required, take  $g = 9.8 \text{ m s}^{-2}$  and give your answer to either 2 significant figures or 3 significant figures.

### Information

- A booklet 'Mathematical Formulae and Statistical Tables' is provided.
- The total mark for this part of the examination is 50. There are 5 questions.
- The marks for **each** question are shown in brackets – *use this as a guide as to how much time to spend on each question.*

### Advice

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.

1/

Pearson

1. At time  $t$  seconds ( $t \geq 0$ ), a particle  $P$  is modelled as having velocity  $v \text{ ms}^{-1}$ , where

$$\mathbf{v} = (3t^2 - 12t)\mathbf{i} + (9t^2 - 3t)\mathbf{j}$$

and having acceleration  $\mathbf{a} \text{ ms}^{-2}$

- (a) Find  $\mathbf{a}$  in terms of  $\mathbf{i}$ ,  $\mathbf{j}$  and  $t$ .

(2)

When  $t = 0$ ,  $P$  is at the origin  $O$ .

At time  $t$  seconds ( $t \geq 0$ ),  $P$  has position vector  $\mathbf{r}$  metres relative to  $O$ .

- (b) Find  $\mathbf{r}$  in terms of  $\mathbf{i}$ ,  $\mathbf{j}$  and  $t$ .

(2)

At the instant when  $\mathbf{a} = \lambda\mathbf{j}$ , where  $\lambda$  is a constant,  $P$  is at the point  $A$ .

- (c) Find the position vector of  $A$  relative to  $O$ .

(4)

2.

Figure 1

A beam  $AB$  has weight  $40\text{ N}$  and length  $3\text{ m}$ .

The beam is freely hinged at the end  $A$  to a vertical wall.

The beam is held in equilibrium at an angle of  $60^\circ$  to the wall by a rope.

One end of the rope is attached to the point  $C$  on the beam, where  $AC = 2\text{ m}$ .

The other end of the rope is attached to a point  $D$  on the wall, where  $D$  is vertically above  $A$ .

The rope is perpendicular to the beam, as shown in Figure 1.

The rope and the beam lie in a vertical plane that is perpendicular to the wall.

The beam is modelled as a uniform rod and the rope as a light inextensible string.

Using the model, find

(a) the tension in the rope, (3)

(b) the magnitude of the resultant force acting on the beam at  $A$ . (6)

If the rope was not modelled as being light,

(c) state how this would affect the tension along the rope, explaining your answer. (2)

Question 2 continued

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

DO NOT WRITE IN THIS AREA

3.

Figure 2

A train  $X$  runs on a straight horizontal track that connects stations  $A$  and  $C$ .

Station  $B$  lies between  $A$  and  $C$ .

Figure 2 shows the graph of the speed,  $v \text{ ms}^{-1}$ , of train  $X$  against the time,  $t$  minutes, after noon.

Train  $X$  leaves  $A$  at noon and accelerates uniformly from rest until  $t = 1$ , when it is moving with speed  $16 \text{ ms}^{-1}$

Train  $X$  then continues to move along the track at constant speed for 15 minutes, before decelerating uniformly and coming to rest at  $B$  at time  $t = 17$

Train  $X$  leaves  $B$  at time  $t = 21$  and accelerates uniformly for one minute, reaching a speed of  $16 \text{ ms}^{-1}$

Train  $X$  then moves along the track at a constant speed of  $16 \text{ ms}^{-1}$  for 10 minutes, before decelerating uniformly and coming to rest at  $C$  at time  $t = 33$

(a) Find the distance of  $C$  from  $A$ , stating the units of your answer.

(3)

A second train,  $Y$ , leaves  $A$  at  $T$  minutes after noon and moves in the same direction as train  $X$  on a parallel straight horizontal track.

Train  $Y$  accelerates uniformly from rest for 2 minutes, reaching a speed of  $24 \text{ ms}^{-1}$

Train  $Y$  then moves along the track at a constant speed of  $24 \text{ ms}^{-1}$  and passes  $C$  at this speed.

Train  $Y$  passes  $C$  at the instant train  $X$  stops at  $C$ .

(b) Find the value of  $T$ .

(5)

(c) State one assumption made in your working that could affect the accuracy of your answer to part (b).

DO NOT WRITE IN THIS AREA

4.

Figure 3

A package  $P$  of weight  $20\text{ N}$  is moving up an inclined plane under the action of a horizontal force of magnitude  $30\text{ N}$ , as shown in Figure 3.  
The force is acting in a vertical plane through a line of greatest slope of the plane.  
The coefficient of friction between  $P$  and the plane is  $\mu$

The plane is inclined at angle  $\alpha$  to the horizontal, where  $\tan \alpha = \frac{5}{12}$

Package  $P$  is modelled as a particle.

- (a) Find the magnitude of the normal reaction of the plane on  $P$  (2)
- (b) Find the range of possible values of  $\mu$  (4)

The horizontal force is now removed and  $P$  continues to slide up the plane until  $P$  comes to instantaneous rest.

Package  $P$  then slides back down the plane.

Given that  $\mu = \frac{1}{3}$

- (c) find the acceleration of  $P$  as it slides down the plane. (5)

(Total for Question 4 is 11 marks)

5. A small ball is projected with speed  $u$  from a point  $O$  on horizontal ground.  
The angle of projection is  $\theta$  to the horizontal, where  $0 < \theta < 90^\circ$   
The ball hits the ground at the point  $A$ .

The ball is modelled as a particle moving freely under gravity.

(a) Show that, according to the model,  $OA = \frac{u^2 \sin 2\theta}{g}$  (5)

A golfer hits a golf ball with speed  $25 \text{ ms}^{-1}$  from a point  $X$  on horizontal ground.  
The golf ball hits the ground at the point  $Y$ .  
The angle of projection is  $\theta$  to the horizontal, where  $0 < \theta < 90^\circ$   
The golfer requires the distance  $XY$  to be at least 40 m.

The golf ball is modelled as a particle moving freely under gravity.

(b) Find, according to the model, the size of the largest possible angle  $\theta$  (2)

Given that  $\theta = 30^\circ$  and that the golf ball is more than 3 m above the ground for  $T$  seconds,

(c) find the value of  $T$ . (4)
